- Length : 10 ""
- Model : Wavebrite 2010 system - 10"" filter

SPECIFICATION

Wavebrite is a treatment system for the management of grey water, which mainly comes from showers and sinks on board the ship. The system has been designed to remove pollutants from grey water before discharge into the sea, thanks to the 4 filtration membranes, eliminating the need for a holding tank, valves and associated pumps. Easy to install, it has a pump with automatic control and provides an effective solution to grey water treatment. The water discharged complies with the EU Council Directive on waste water treatment (91/271/EEC). The system is available in a range of sizes to suit different requirements (from small recreational vessels to large commercial applications). A Wavebrite grease trap is also available, which greatly improves the efficiency and durability of the entire system.

- The basic system consists of five main components with four-stage wastewater filtration:
- Wavebrite main module, pre-filters, pump, strainer and 16 l tank with sensor.
- The components are modular and can be placed separately, connected by a flexible hose for easy installation.
- The basic models have a maximum flow rate of 15 l/min with an option to increase this on request.
