

Kit de réarmement manuel 33gr

Réf : **LIF2800**

The United Moulders (UM) lifejacket inflator features a screw-in cartridge that activates on contact with water. The cartridge mechanism uses a high-powered compressed spring held in place by a paper element. When the paper element dissolves, the spring is released, allowing the ignition mechanism to puncture the CO2 cylinder. The CO2 is then directed through a manifold to inflate the lifejacket. This automatic system is accompanied by a manual control, allowing the user to pull a lever to inflate the lifejacket.
